

Security is our only business

Enjoy the confidence of knowing your network is secured by a proven winner in managed services. SecureWorks is the fastest growing and largest privately held Internet security firm in the U.S. SecureWorks is the only Internet security company to be named to CIO Magazine's 2004 "CIO 100" list.

Rock-solid managed security services for Cisco® — no hassles, no headcount and no capital outlay

Unless you're in the Internet security business, security should not define your business—diverting your attention from your priorities and tying up your resources at the expense of competitive advantage or customer service. In a world where more than 50 new threats and vulnerabilities appear every day, rock-solid Internet security requires more than just security products—it demands a security process and the expertise to monitor and manage that process.

Cisco Systems® and SecureWorks are the allies you can depend on for the products and the process, offering you an unmatched network security defense force.

Cisco provides the Cisco PIX® Firewall and Cisco Security Agent software for identifying and preventing attacks at the firewall, host, application, protocol and user levels. SecureWorks manages the process with Managed Firewall and Host Intrusion Prevention services.

SecureWorks provides the intelligence you need to defeat the thousands of attacks that even the smallest networks battle—typically 5,000 every month for even a small network of 30—identifying new types of attacks before they happen, and uncovering vulnerabilities that threaten your business.

Managed security puts your business first

Many organizations have overcommitted and understaffed IT departments. Others have only part-time or outsourced IT resources. Rather than adding Internet security to their mission, managed services from SecureWorks allow you to focus on running your business, not defending it.

Take advantage of the combined force of Cisco solutions and SecureWorks services today. Call SecureWorks or visit our [Website](#) to learn more about the power of Cisco Systems and SecureWorks for best-in-class products and reliable managed services that will allow you to put your business first.

"The results from engaging reputable, competent managed security service provider have the potential to be far superior to anything an organization can achieve on its own."

— CERT, Carnegie Mellon University

SecureWorks takes the hassle and the headcount out of Internet security

With SecureWorks, you'll benefit from:

- Use of a state-of-the-art security operations center with two-factor biometric access control and an infrastructure constructed with network, power and system redundancies—eliminating the need to invest in the capital outlay for facilities, hardware and software.
- The skills, training and experience of our security specialists, who have dealt with millions of threats and vulnerabilities—eliminating the cost of hiring, training and retaining more headcount for 24x7x365 monitoring and management.
- Advance warning of new vulnerabilities and early access to countermeasures, eliminating the need to track and address threats and vulnerabilities, attack patterns, intruder tools and current best practices.
- The benefit of shared experience—where trends and patterns experienced by other businesses are leveraged in a combined profile of attack behavior to better defend your network.
- Comprehensive reporting that gives you the insight you need to maintain and update your network without fear of introducing vulnerabilities, as well as the documentation you need to meet regulatory and industry best practice requirements.

Firewall management service

SecureWorks provides comprehensive and adaptive managed security services for Cisco PIX firewalls, including:

- Site assessments
- Firewall policy design
- Firewall equipment installation and configuration
- 24x7x365 firewall monitoring and administration
- Comprehensive reporting and emergency response

Host intrusion prevention service

SecureWorks managed host intrusion prevention service (IPS) protects your servers from attacks on your applications, data and operating systems—including threats from the outside in and vulnerabilities from inside your network. Host-based IPS provides a more reliable defense against encrypted traffic, dial-up users and mobile computing—all vulnerabilities that bypass network-level security. Host intrusion prevention service gives you:

- Behavior-based attack blocking in real time
- Protection against attacks that bypass perimeter security
- Policy management
- Update notification on patches and fixes from hardware and software manufacturers
- Comprehensive reporting and emergency response

Combine best-in class products with state of the art managed security processes

Cisco Systems brings you best-in-class hardware and software for defending your network. Cisco hardware and software balance flexibility, scalability and manageability in a comprehensive, modular solution. SecureWorks adds the expertise and resources to manage your security process around the clock and around the calendar. That means enhanced security, lower total cost of ownership and lower operating costs.
